

DailyKind

Meilenstein 2
App Entwicklung

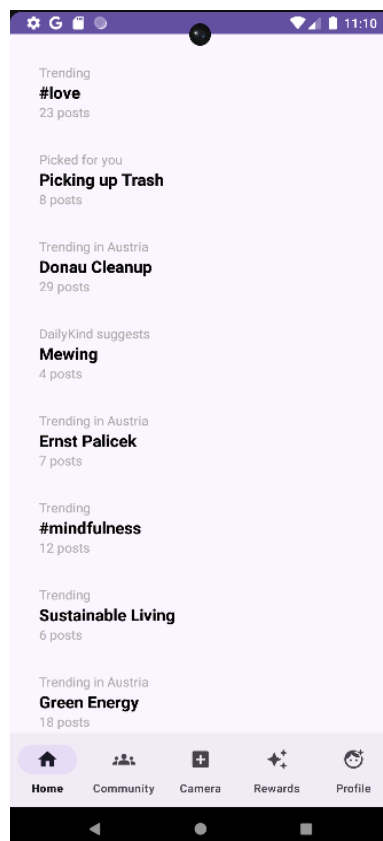

Navigation(Hub bar): (AS)

To make our app as user-friendly as possible, we have implemented a hub bar from which all the main functions of the app can be accessed. We have decided in favour of this because it is already established in many other apps. This means that many people already have years of experience with hub bars, which improves their user-friendliness and acceptance. As the hub bar works well in many apps and is rated positive by people, we are convinced that it will also be successful in our app. Since our main target group uses such apps, they will easily understand how to navigate through our app.

Homepage: (JFK)

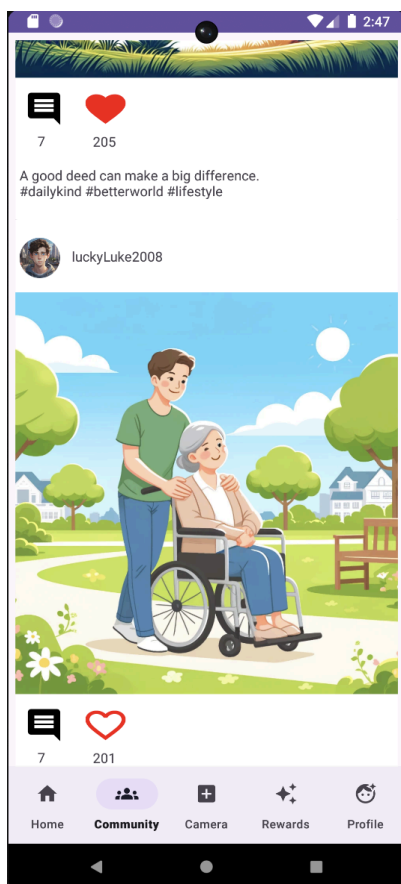

We opted for a Trending page that recommends both hand-picked curated deeds and community-suggested events. This approach simplifies the process by combining both types of suggestions in one place. Instead of managing them separately, a trending algorithm will allow the community to thrive organically, with occasional curated suggestions added in. As discussed in previous milestones, we sought a way to integrate both types of deed generation, and this solution achieves that elegantly.

Socialmedia: (AS)

On the social media screen [SM1], you will see the part of the app where users can share experiences with each other. Users can scroll through the posts and interact with them by liking and/or commenting on them. Clicking on the heart turns the icon red and the number of likes increases by one. By clicking on the comment button (next to the heart), users land in the comments [SM2] of the post.

The design has been kept as minimalist as possible so that older people are not overwhelmed by too many buttons and links. In addition, care has been taken to ensure that all buttons are easy to press, which is why they are slightly larger than usual. The implementation of comments and likes should motivate users to perform more deeds and share them with others.

Camera: (IB)

The Camera functionality allows the users to take pictures directly in the app. The pictures can be taken with both the front and the back camera, and the user can toggle between the two by pressing on the denoted icon on the bottom left of the screen. The user can also directly access the phone photo gallery, where they can decide which photo they want to post. The posts themselves are handled on the server side and are not in the scope of this prototype. The gallery icon is placed on the bottom right of the screen. The placement of all buttons is similar to the ones in the built-in camera, and should thus be intuitive for all users. When the camera is opened, the navigation hub gets hidden, in order to minimize distractions. The user can exit the camera by pressing the back arrow from the android navigation bar at the very bottom of the screen. To facilitate this, the individual fragments are added to a back stack so that they can be retrieved by pressing the “back” button. Additionally, an “onBackPressed()” method had to be implemented so that the highlighted page in the navigation hub is always the relevant one.

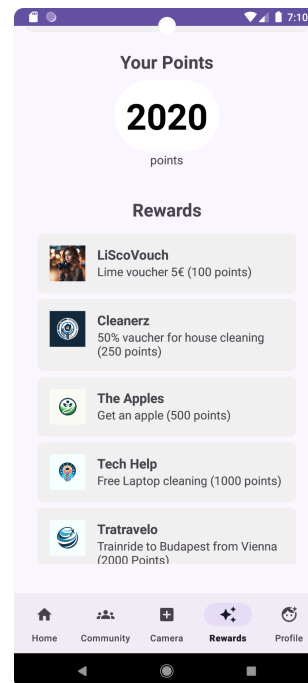

Leaderboard/Reward Page: (MH)

The leaderboard and rewards page is designed to enhance user engagement through a structured display of achievements and incentives. The leaderboard section displays the streak count at the top, accompanied by a streak multiplier, which modifies the way points are received and serves to motivate users toward daily participation. The top three users are visually distinguished through the use of profile pictures and their placement on a podium, thereby enhancing competitive visibility. Below the top three, additional users are listed based on their respective streaks, ensuring comprehensive visibility of all participants' progress.

The rewards section displays the total points at the top, ensuring users are continually aware of their points balance. Below this, a catalogue of rewards is presented, each accompanied by a brief description and the requisite points for redemption. This presentation of rewards, which includes varied incentives, caters to diverse user interests and bolsters motivation to accumulate points. The bottom navigation bar remains consistent with that of the profile page, facilitating easy and intuitive navigation throughout the application.

Profile page: (MH)

The profile page of DailyKind is designed with a focus on ease of use for all age groups. The user's profile picture is centrally positioned at the top, ensuring immediate visual identification. Directly beneath, the username is displayed, facilitating user recognition. Essential user information, including email, password (which is masked for security), address, and country, is systematically arranged within an editable form layout. Each piece of information is segregated into distinct input fields, signifying their editability. The password field incorporates an icon allowing users to toggle the visibility of their input, thereby enhancing usability. A "Change Data" button is placed at the bottom of the page, enabling users to make any modifications to their profile data. Pressing the "Change Data" button (which then changes to "Save") saves all changes and locks the data again. As on all other pages, there is a fixed hub bar at the bottom. This design ensures seamless access to various sections of the application, as well as ease of use and a clear display of the data.
